-------	----	------	-------	--	-------	------------------	--

All investigations have their Limitations which are imposed by the limits of sensitivity and specificity of individual assay procedures as well as the specimen received by the laboratory. Isolated Laboratory investigations never confirm the final diagnosis of the disease. They only help in arriving at a diagnosis in conjunction with clinical presentation and other related investigations. Report may vary depend on technology. Value of two technologies are not comparable.

All investigations have their Limitations which are imposed by the limits of sensitivity and specificity of individual assay procedures as well as the specimen received by the laboratory. Isolated Laboratory investigations never confirm the final diagnosis of the disease. They only help in arriving at a diagnosis in conjunction with clinical presentation and other related investigations. Report may vary depend on technology. Value of two technologies are not comparable.

SEROLOGY								
SERUM	ANTI HBc Total	Nonreactive (0.13)		S/CO	Less than 1.0 - Nonreactive; 1.0 or More than 1.0 - Reactive; METHOD:CMIA	Dr.U.	22/09/2026:11:18	

Presence of Anti-HBc is an indicator of current or Past HBV infection. It is found in serum shortly after the appearance of HBsAg in acute HBV infections and persist after the disappearance of HBsAg and before the appearance of Anti-HBs. If other HBV markers are absent and the presence of only Anti-HBc may be considered as actively infected with HBV infections or infection may have resolved leaving the person immune.
